On Clustering Daily Mobile Phone Density Profiles

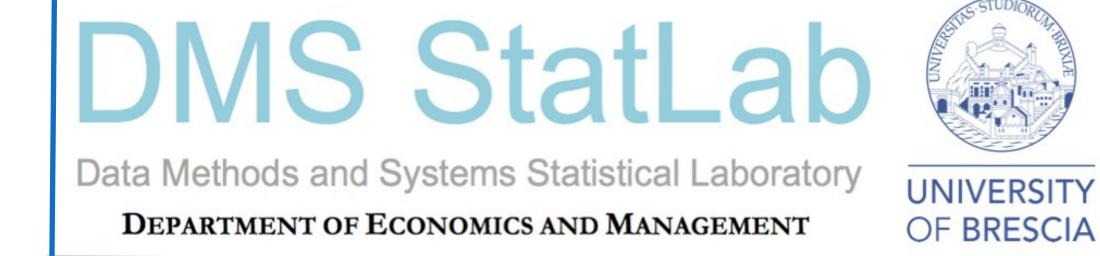

1. Context & Objective

Daily Mobile Phone Density Profiles (DMPDPs) are characterized by a 2-D spatial component (i.e. the cells of the grid) and by a temporal component

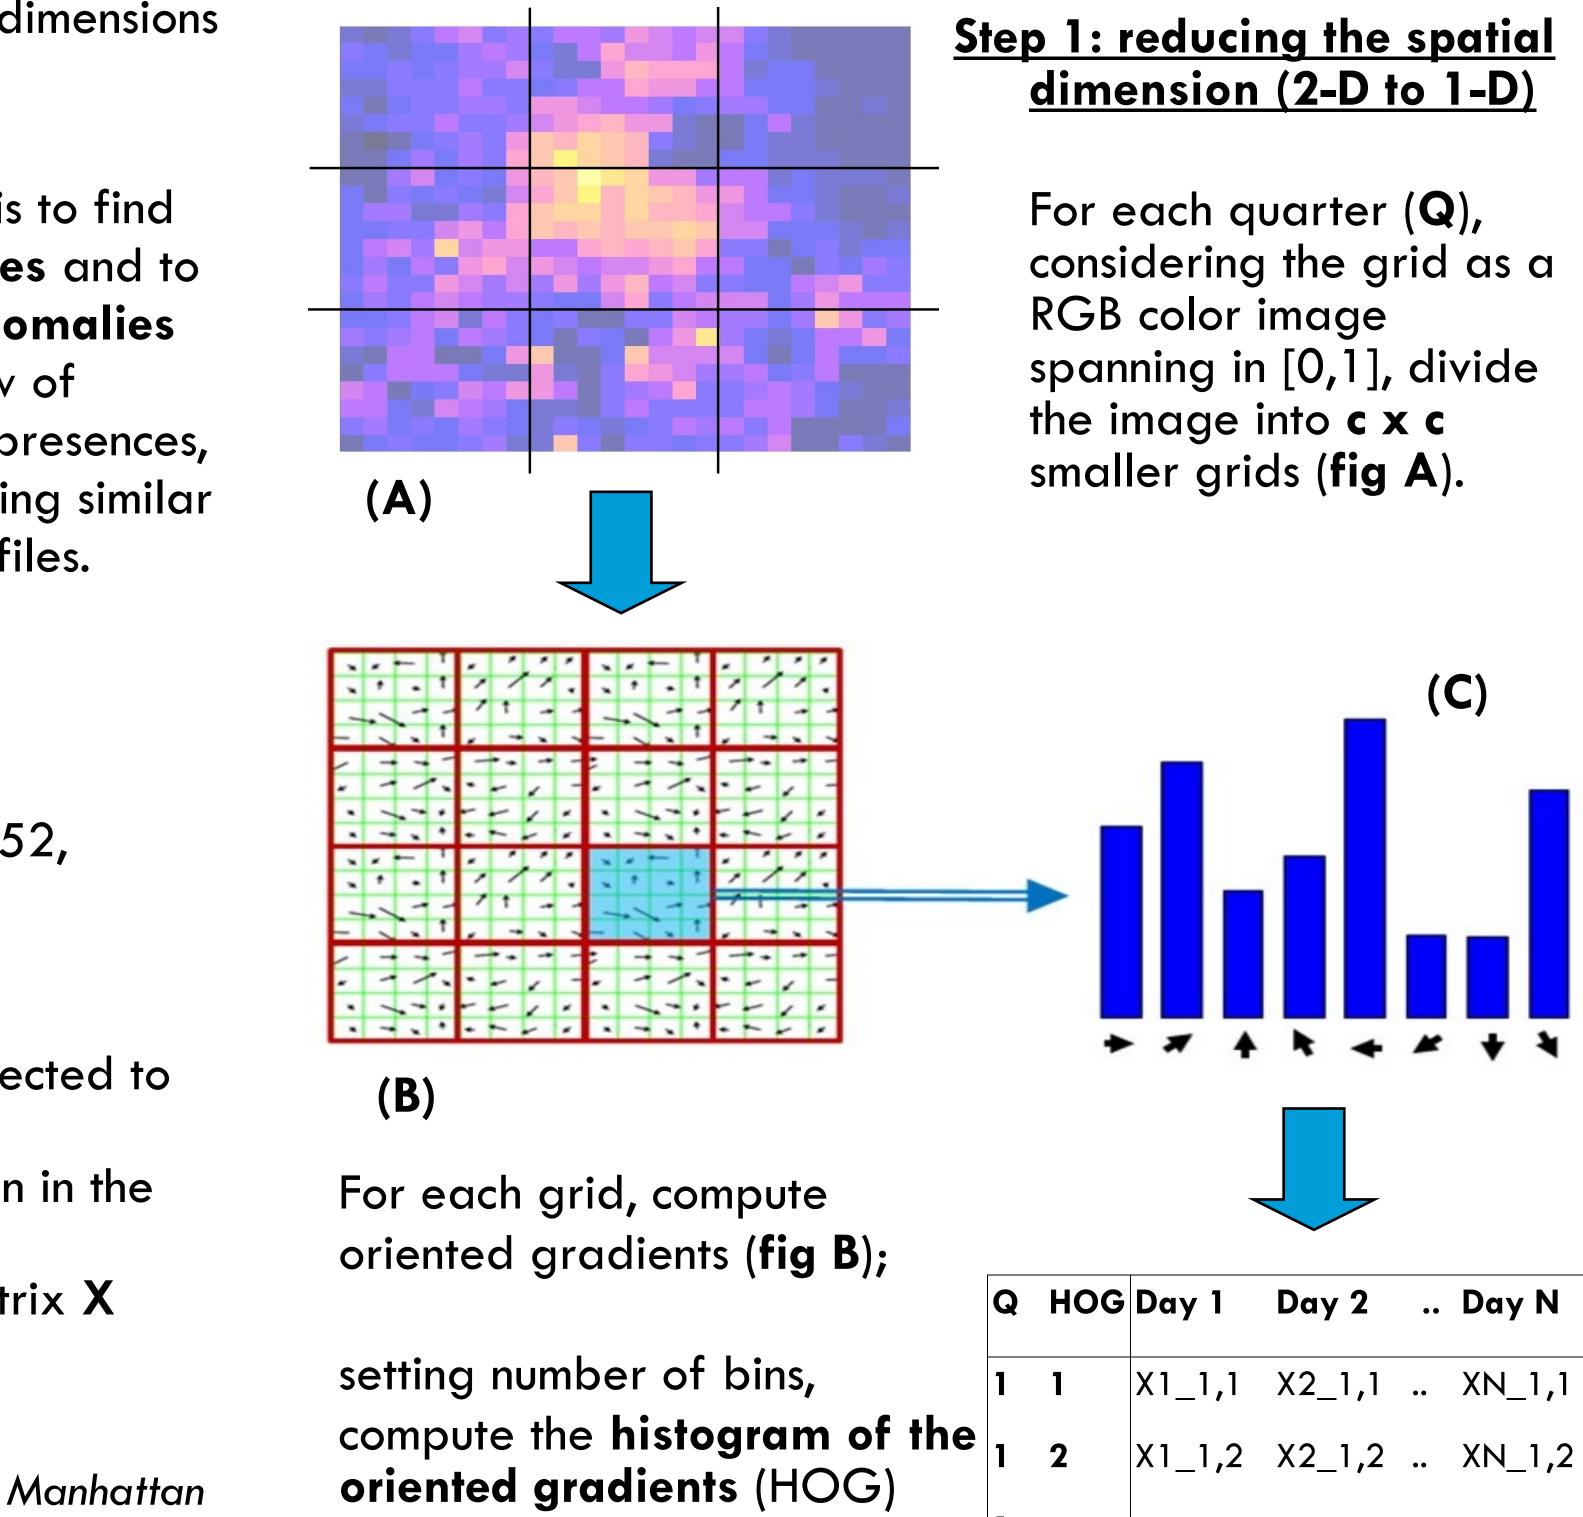

Rodolfo Metulini (Univ. Brescia, Italy) - rodolfo.metulini@unibs.it

Maurizio Carpita (Univ. Brescia, Italy) - maurizio.carpita@unibs.it

2. The Approach

Step 1: reducing the spatial dimension (2-D to 1-D)

For each quarter (\mathbf{Q}) , considering the grid as a RGB color image spanning in [0,1], divide

(C)

.. Day N

3. Application & Results

We select the grids of the city of Brescia (lat/long [10.2, 10.24, 45.52, 45.55], dim 24 x 24), from March 18th to June 30th, 2015.

We extract HOG features by dividing each grid into 9 8x8 cells. In each cell, gradients has been computed and **5 bins** have been selected to

compute the histogram.

Each grid counts for 45 HOG features, with a dimensionality reduction in the order of 576/45 = 12.8.

Stacking in the same column all the quarters of the same day, the matrix X counts for 4320 variables and 105 objects (days).

We apply a cluster analysis Cosine Euclidean using k-means and k-medoids with Manhattan, Euclidean and Cosine distance. The curse of dimensionalty does not subsist.

X1_1,h X2_1,h .. XN_1,h h

 \boldsymbol{b}_R

(E)

 a_R

For each cluster, we plot the first tensor (r=1) component to display regularities and outliers.

stack into a vector the **h** HOG values of the 96 96 h X1_96,h X2_96,h .. XN_96,h quarters of the same day, producing the matrix X (fig D) **(D)**

••

Step 2: grouping daily profiles

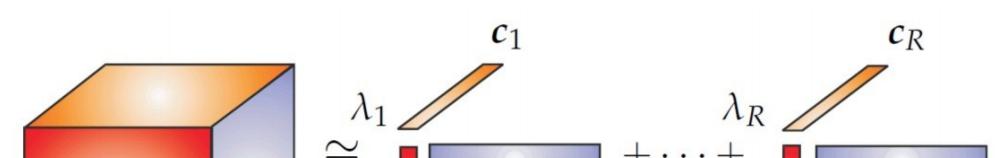

(fig C);

Apply an high dimensional **cluster analysis** to group days (X's columns, objects) in terms of the HOG features (X's rows, variables)

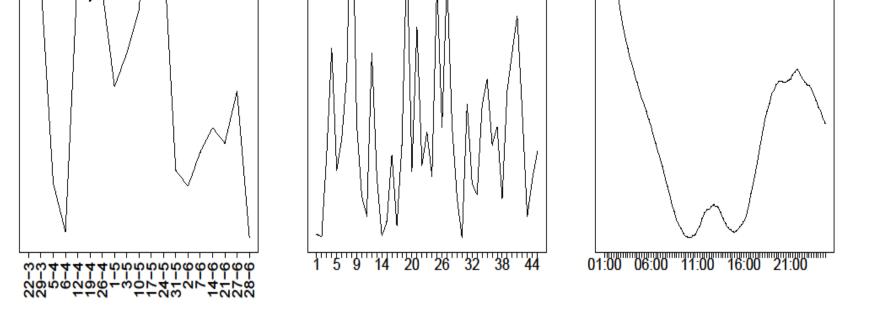

Step 3: detecting trends & outliers

For each group, consider the 3D array with dimensions a (quarters), b (days) and c (space, HOG values);

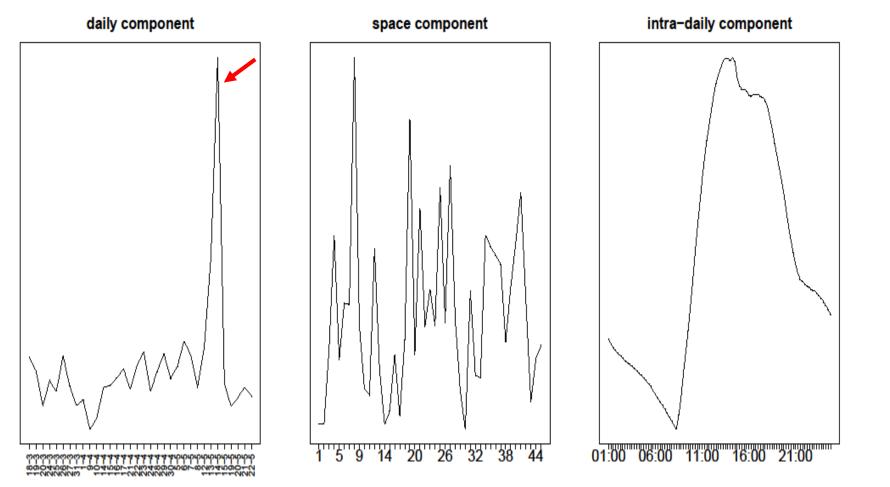

estimate the Canonical polyadic (CP) **tensor** decomposition (CANDECOMP/PARAFAC, fig E)
